

01/06/2026 : First Session Introduction

First week : PEN & PAPER FOR writing notes

→ RE-NEWABLE membership every month

⊗ Sundays : CAREER UNLOCK SESSIONS SAME AS where we SET THE COARSE

⊗ Program Overview

⊗ Introduction of Instructors

- AI Literacy, understanding it and how to use it.

- AI Coding and how to use different tools

- Prompt ENGINEERING

- He Build his APP - using over 500k without Funding

→ DATA ENGINEERING Instructor: KETRO SITHOLE

⊗ HE IS A SUPERBELIST DATA ENGINEER

Essential Skills as a Data Analyst

- 1. Presentation skill very essential
- 2. Speech practice on video for 30 days 5 min 10 days
- 3. Speech by videos practice for 30 days 5 min 10 days
- 4. Followed by 15 min for 10 days subsequently 30 mins
- 5. Each practice, practice practice

Learning Quality

Learn the Eligibility, Rule Chng /
→ Map the Course Curriculum

Golden Rule: Master what you are doing

First then move to the next

Course:

In person / Not Course will be Data

Engagements:

1st July there will be a 5 months

Data Analytics Intake

Weekends: SAT 09:00 - 10:30

SAT 19:00 - 20:30

Sun 20:00 - 21:30

Second Session: Data Foundation 02/06/2026

Onboarding Day 2

- Data Bricks it is a platform where you build eg report, dash board etc.
- * Deploy AI: Applying Intelligence for solution * you do not coding on this platform
- Data Bricks platform is free
- Links and other resources are on external tutorials
- Google or research about Data Bricks:
- * What is Data Bricks
- * How does it work
- * How is it used
- * Check Youtube for Data Bricks for Beginners

→ Data Bricks Certification:

* If you want to be certified data analyst

you can do it via Data Bricks

* It is important to follow the process, get

knowledge and skills first then after you

can do the certificate or take a test exam.

→ Microsoft Credentia / Certificate

→ Learn how to use the tool and build

the projects and portfolio

→ Recommended certificate for a beginner

Microsoft Azure Fundamentals certificate

→ GitHub Platform * ^{or uses} GET IT ON Google Drive
Where you build portfolio
* It is used to build Portfolio

→ storing our portfolio → Repository

→ Canva

* used to present, store and build our presentation

→ Google Sheet vs Excel

* Same thing you can do on Excel you can do with Google Sheet

* NB!!! I should master learning how to use this platforms and applications.

* AI Tool can be used to build an interactive Dash Board

* SMART DASH BOARD

Bright learn only want people who wants to learn, who does not want to take accountability

→ LIST OF PLATFORMS

- | | |
|----|-----|
| 1. | 7. |
| 2. | 8. |
| 3. | 9. |
| 4. | 10. |
| 5. | 11. |
| 6. | 12. |

DATA BRICKS

- USERNAME: email.
- PASSWORD: AMAN1991
- ACC Name: SIUCM33 - Free edition

DAY 3 SESSION 3 DATA ANALYTICS

WHAT IS DATA ENGINEERING

* DATA ENGINEERING → Is a practice of

- COLLECTING DATA
- MOVING DATA
- CLEANING DATA
- STORING & ORGANISING DATA.

* So that system and people can use it for reporting, dashboard, analytics, machine learning and decision making.

* DATA ENGINEERS BUILD systems that make data, available, reliable, secure and easy to use.

→ ABAW: CRM: Customer Relations management.

OLTP - Online Transaction Processing: DATA BASE
OLAP - Online Analytical Processing: WAREHOUSE

DATA CONCEPTS → DATA BACKEND

DEFINITION OF DATA: →

↳ DATA IS EVERYWHERE

↳ DATA IS A COLLECTION OF FACTS

↳ DATA IS INFORMATION

DATA IS USED TO ANSWER BUSINESS QUESTIONS.

DATA COMES IN DIFFERENT FORMATS

↳ Refers to the data stored in a table with rows & columns. * Has no specific format

↳ it is inconsistent e.g. music Podcast, Pic, vid website, Youtube.

↳ Consistent Format.

	Col 1	Col 2	Col 3	Col 4
row 1				
row 2				

NB!! With ML & AI you can process the unstructured data →
↳ Indexing etc Python Coding, AI

→ Spread Sheet (Excel, Ppt)

→ Membership Form

FRONT - END

BACK - END

NAME: SUE
SURNAME: NEMYS
AGE: 22
LOCATION: JHB

ID	NAME	SURNAME	AGE	LOCATION
1	SUE	NEMYS	22	JHB
2	IFISO	MAHMOUD	23	CPT
3	LESIDI	NONJIC	30	PJA

When you fill in a form, we create ID or Index to different people

Order Number at KFC → They are associating every number with transaction.

Order ID	Product	REVENUE	TIME & DATE
101	STMT 2	R40	20:00 03/06/2026
111	Icecream	R5	21:00 04/06/2026
204	All STARBOX	R80	22:00 05/06/2026

→ This is A DATA COLLECTION

↳ Point of Sale

NB!! INTERGRADE: SAP & MINE SUIT.

DATA HELPS TO MAKE BUSINESS DECISION / TIME IS FUNCTION OF A DATA.

DATA DOES NOT OPERATE WITHOUT TIME

Product	LOCATION	DATE TIME	REVENUE

DATE Component is very important when dealing with DATA: (I am brilliant)

Upselling strategy: 2PCS R40 / Body lotion R60 up/sell 3PCS R60

DATA will tell you which product to upsell
& cross-sell

Cross-sell - Buy Combo

Buy body lotion + shower gel	For R100
---------------------------------	----------

Complimentary product.

GEICO space: VOICE/DATA/
All this DECISION ARE DATA DRIVEN

21:00 : GET COLOURS

SESSION 4: DATA ANALYTICS 04/JUNE/2026

→ INTRODUCTION TO DATABASES SECOND DAY

DO RESEARCH ON Youtube:

→ What is DATA Analytics vs DATA science,
DATA ENGINEERING ALSO

Go on ON BrightLearn CHECK where do
our Graduate work and the day to day
work.

Collecting data into data base

Big Announcement in Class:

it is used to capture data as you buy and not used for analysing data

Basic SQL Queries
void is delete

DATA Architect → Draw the plan or Plan how the data should be

* DATA ENGINEER → is a man that buys food and DATA analyst cooks the food → report & why's build report on the DATA board. SCIENTIST predicts the future, the revenue, Break downs etc.

* DATA WAREHOUSE:

is a central system that store clean, organised historical data, from many DATA bases (system) designed for analysis and not transactions.

It is used for business intelligence, eg the results of this are those upsell, cross-sell

ETL VS ELT

ETL - Extract, Transform, Load

ELT - Extract, Load & Transform

This is what the DATA ENGINEER DO

DATA BRICKS:

∴ DATA ingestion

* Then list of sources, SAP, AMAZON
Then load DATA into the DATA management system

* 2007 DATA Management System

① DATA points → DMS

2) Context
default

Boot Camp Visualization 19:00-21:00

→ First layer, DATA visualization

① DATA Story telling

② DATA is Information

DATA
↳ is information

③ we need to be able to tell a story to a business, ~~from~~ data.

④ package the DATA in a way that you can tell a story

we → you need to be able to tell a story from your DATA

→ you need to drive/extract actionable insights from DATA

↳ Drive well informed DECISIONS

⑤ Revenue

eg ⑥ MR CEO, The revenue increases, when we hold specials on weekends, or when we have rewards for specific products.
w/bali & Thabang

DATA → recommendation
prescription

DATA PROCESS

DATA WAREHOUSE

→ Relational data base → we store structured data that can be related/joined together to become:

In a relational data base we store structured data that (dimension table & fact tables) that can be connected to one another using primary key and foreign key

software

Primary key is a unique identifier that differentiate each component from the table e.g. your ID no

Interview

Customers table is a dimension table

cust_id	name	age	city
1	Robert	28	NY
2	JEF	22	LA
3	Murk	18	MS

Product table is a dimension table

Prod_id	Prod_catgry	Prodname
101	Fruits	BANANA
102	Fruits	Apple
103	electron	laptop
104	clothing	shirt

Dim-table
→ it spots the banana because the product name does not change

→ Dim-table - Dimension table contains descriptive information (change frequently)
→ A dim table does not constantly change

→ Fact table contains numbers only

order_id	cust_id	Prod_id	Qty
324	2	104	70
333	1	102	80
401	3	104	100

Fact Table
→ Foreign key - is a primary key from one table that is found in another table

→ Fact table - only contains numbers inside the table
→ Fact table, has foreign keys
• Contains numbers
• used for analysis
• fact table contains different ID from different tables

- We code to clean DATA & only be left with what I want understand the process before doing process
- Before Coding you need know what do you want to show by leverage per week, trend, profit by category or product.
- BI Report is for reporting

Why do we need to code?

- DATA inspection/Exploration
↳ To see what data is available
- DATA Exploratory Analysis
↳ To understand the relationship between our data points

We code to retrieve, to remove, to update, to manipulate, to clean, to aggregate, to join, to delete, to update with the goal of extracting actionable insight

Create Feature Building

What happens After Coding

- You end up with a summarized table
- Aggregated table
- combined table
- You can build a power BI report
- table that I can report for.

① Show us Practically why we need vizual
 BI Usable actually

you need to know why build it.

② I think why we need vizualization
 → when applying Coling/you summarize, they make 2 vizual

③ work space: DATA BRICKS Platform

→ In

→ how do you know when to use pie chart

④ Before building a vizual we need to know where, type of graph we are going to use, when and why use it

* Mind → that where he draw in charts

⑤ First thing happening in a business

Business Requirements
 The ASK-ITting
 There is behind
 What can we do to move forward
 or increase revenue

CEO: I want to understand the revenue for our product for different

Large Visualization
 creating graphs
 Data Presentation
 putting things together

Large visualization
 creating graphs

DATA PROCESSING

Business understanding

What is it going to solve what question is it answering

Solve a Problem
 before building dashboards, first understand the business requirements. Then ask before building dashboards that are data driven visualization

READ DATA STORIES NB!!!

21:00

PLAY PHAKADI LAM

chart comparison trends

⊗ DATA Studio

⊗ Chapter 4 & 5

DATE: 06/06/2026 @ 19:07 SESSION NO: 06

BOOTCAMP DAY: 2

- ⊗ WE USE A DMS TO ACCESS DATA
- ⊗ DMS → CONNECTED TO OUR DATA
- ⊗ IN DMS → WE CODE - PINK

DATA BRICKS
SINCE FALKE
MICROSOFT FABRIC

→ DATA GETS INTO A DATA WAREHOUSE

→ DMS → is an interface, that allows us to interact with our DATA, update, create or DELETE SOMETHING

→ WHY SHOULD WE CODE: to retrieve, to aggregate

⊗ CODE TO COMPRESS OUR DATA, SOME CAN USE IT TO CREATE SOMETHING

Tonight we start with

It is easy to use the tool, but you need to know what do they want to see

⊗ Building dashboard → we should have an ask or business requirements to satisfy or BUSINESS NEED

⊗ CEO - want to the REVENUE for our coffee shop for different products

↳ THE CEO WANTS TO TRACK THE REVENUE DAILY FROM THE COFFEE

BEFORE YOU BUILD, ASK THE DATA DRIVEN QUESTION ⇒ CEO will just give clarity and DATA DRIVEN QUESTION will be ANSWER BY DATA utilisation

↳ would you like to see the daily REVENUE? would you like to see the repeat customer THE FREQUENCY

↳ what KPI's would like to measure?
REVENUE? number of customer? Distinct Product
(M-O-Y) (M-O-M) (W-O-W) (WTD - month to date)
(YTD - year to date) (T-1 vs T-2)

⊙ NB!! Asking This Question will assist or help you deliver what the client need.

→ EXERCISE FOR AFTER THIS SESSION IS READY

→ NB!!

⊙ when building DATA visualization, It is important to know when to use a specific graph.

THE DATA DESIGN BLUEPRINT

→ Choosing the right Chart For Effective Story telling

METRIC - refers to something we are measuring e.g. REVENUE, NO of customers, NO of transaction

A METRIC → is numerical data or quantitative (measurable) number for data related to numbers

CATEGORICAL DATA → Is grouping DATA

→ is data that puts our information into groups → mainly words e.g. male, female

LEGEND-SPLIT → Categorical data

Female Male

→ A split/legend gives you a detailed breakdown
↓
granularize

LINE CHART → Showing trends over time
look for the dates that is continuous

DATE Time — Continuous trends
→ month, day of week, year, date

→ 2022-2023-2024, 2025

Showing Proportions: PIE CHART

- Categorical Breakdown
- Metric to proportion

Proportion distribution
over a 100% of
REVENUE / profit

Beauty 60% → Majority of our profit or revenue comes from the beauty product.

metric
③ REVENUE By Category

STACK/BAR GRAPH → Show Proportions on different days

NOTE: understand when to use what when.
Stacked Chart

→ Showing proportions for two different categories/ DATA by a specific metric

Product Category	DAY OF WEEK	This category is well day of a week
- Electronics	Monday	
- Beauty	Tue	
- Clothing	Wed	
	Thursday	

Introduction

EXCEL & DATA studio Platform
Kaggle → To get DATA for practice

You have been provided with a dataset titled "Bright Coffee Shop Sales", which captures daily transactional information from a Coffee Shop.

The business has recently appointed a CEO

DATA Give with categories: ON EXCEL
→ Time bucket

① 1st thing to do Click top left  between I & A Click insert pivot, insert pivot

② Pivot table Field .. (names)

Filter	Columns (Splits / legends)
	Store location
Row	Value / metrics
Month → Drag from field names	Sum of sales
→ axes	

① Go To Design For naming the graph

on the sheet tab - name processed DATA

② Right Click on pivot table, then go to
Show Value as percentage or any other.

③ Consistency in legends on your right side
colours same and label graphic.

④ When explaining or showing values use
percentages because it helps a lot

⑤ Sum of sales in percentages it helps

DATA Studio another tool to use

[E route]

— create report (new)

CSU File upload

Create dataset - (Coffee Shop)

upload it

Add a chart / at the top left double click

properties - use to change how your graph look
like different

DATA

~~set up & style~~

SETUP

Dimension

Store location - stores

Metric

Revenue

style

Chart title

Revenue distribution by
Store location

at bottom edit text
describing

076198007

Build one

Scorecard Properties

Theme and layout use 3 dots

Create logs of canvas

Theme and layout

Chat GPT [NB!!! add to your English learn log]

upload your data

Next Boot Camp

Create a prompt / take the prompt to / available

If they want presentation (sent by excel) paste

Note Book Lm - Platform

Student number: 2805002311

For cleaning it is best to code then work by guidelines.

DATA BRICKS is build the optimal process through excel - process it in code

How to process data via youtube

This coming

SESSION 07 DATA ANALYTICS 08 JUNE 2026 21:00-22:00

SQL - Beginner!!! easiest

2 things involved - provide information to succeed

Challenges

Practice every for 30min / coding
People gain and make excuses leave and come back later - Be consistent with classes and doing work
Fights the only way to succeed

If you don't Be consistent for the coming 90 days

Concept of data should

unstructured data

Light is information we use to make business decision.

(I thought we focus on structured data.)

~~Structured data~~ & ~~unstructured~~

Should point to data stored in a table / inside a database

When we have data - we need to extract insights from the data

SQL - we have a Structured Query Language (SQL)

SQL is a scripting language that we use to interact with structured data (structured table)

we use SQL to retrieve data / information from a structured table (there is a structured table that exist)

Students table - results

Student ID	Name	Marks
101	John	99
102	Michael	25
103	Thabo	50
104	Leah	60

→ a student

1st function - SELECT statement - allows us to select the specific columns from our table

It does not go alone, it goes with:

FROM statement

allows to specify the name of the table we are selecting the data from.

SELECT name, marks

FROM student - results

The select statement allows you to specify the column you want in your final report - you could have 1000 columns, but it gives you specific column

name	marks
John	99
Michael	25
Thabo	50
Leah	60

SELECT *

21.49

FROM retail-sales-dataset
-- SELECT * is a way to select all the columns from your table without specifying the columns one by one

55 - This is the first coding

```

SELECT Date, Gender, Age, Quantity
FROM retail_sales_dataset

```

- When you are selecting specific column names, you separate each column name by a comma (,) on the 1st
- On the last column you specify, you do not put the comma (,)

Another concept in SELECT

SELECT DISTINCT statement

- we want to get different values from a specific column
- we remove duplicates / we do not repeat the same value

distinct → means different (unique)

syntax: SELECT DISTINCT Column_name
FROM table_name;

```

SELECT Date,
Gender gender,
Age,
Quantity

```

FROM retail_sales_dataset;

SELECT DISTINCT 'Products_name'
FROM Fruits_orders;

Product_id	Products	Price
Order_Id	Prod_name	REVENUE
101	Apple	100
102	Orange	50
103	Apple	60
104	Banana	150

Products_name
Apple
Orange
Banana

Specify the column name you want different values from

- Write a SQL code to give me the different fruits he is selling.

SELECT DISTINCT Prod_name
FROM fruits_orders;

Prod_name
Apple
Orange
Banana

It removes duplicate itself
Remove duplicates

new query → DATA BRICKS / SQL editor
SELECT DISTINCT

How many product categories are in this table
it is not easy to tell

SELECT DISTINCT (product category)
FROM retail_sales_dataset;

USE column of the GENDER, high list and press
ENTER

SESSION 08 DATA ANALYSIS 09/JUNE/2026 21:00-22:00

SQL - Structured Query Language (SQL)

CHOOSE ONE thing and master it, only jump after
you have mastered it.

SQL - is language designed to deal with
structured data

- 2 ways

①
SELECT *
FROM table

→ selecting all table the
columns from our table.

②
SELECT DISTINCT column
FROM table;

→ Different values from a column

→ No duplicates

SELECT column 1
column 2
column 3

Filtering Statement: Tonight

FROM table-name;

(this) we want to select specific
columns from our table. we specify
the columns we want

Today (DATA Cleaning & Processing)

FILTERING STATEMENT →

DATA Filtering →

→ we filter data if we want to get specific
information from our data (specific only
for 2026)

→ is a way to exclude rows of data that do
not meet a specific criteria

→ you want specific information.
→ we filter based on conditions

we use THE WHERE statement
Syntax: SELECT column 1,
column 2,
column 3

250
260
270
280

WHERE statement

Syntax: SELECT Column1,
Column2,
Column3

FROM table_name

WHERE Column Condition;
Student_results.

Student_id	name	marks
101	Rafhi	99
102	Abali	25
103	Thabo	50
104	Lethabo	60

write an SQL Query
to give me only
the names of student that
obtained more than 60% in Exam.
obtained 60% & more in exam

SELECT *
FROM Student_results
WHERE marks > 60;

Student_id	name	marks
101	Rafhi	99

Filtered table

Reduced table

SELECT * FROM Student_results
WHERE marks >= 60%;

Student_id	name	marks
101	Rafhi	99%
104	Lethabo	60%

Filtered table

start this all the time - a (SQL BOLT)
SQL Editor on your left.

SELECT * → selecting all in your table
FROM retail-sales-dataset;
WHERE Gender = 'male';

highlight the code and run it.

SELECT *
FROM retail-sales-dataset
WHERE Gender = 'male';
2 column WHERE Gender = 'male' AND 'Product category = 'Electronics'
Now The number of rows reduces and
myself only

[Alex → DATA BRICKS]

WHE

CHAT GPT plus → Ask it how to
explain the where statement
(DATA filtering on
SQL)

THE STATEMENT

Self Study (Practice/online now) SQL - Statement learnt or discussed so far

The ~~first~~ Functions we are learning ARE The Following:

* SELECT statement: It allows us to select the FROM table_name; specific Columns From The Table.
① Every After Column name put comma(,) on the 1st one we do not put anything

* SELECT *: It is a way to select of Columns without from table_name; specifying them one by one

* SELECT DISTINCT statement: Allows us to get different or unique values from a specific column, It removes Duplicates (use The category name column of column)

① We use a Category name on a Column.
e.g. Fruits_name it will specify Fruits that are sold without repeating it, BANANA, APPLE

(WHERE statement -)

* FILTERING STATEMENT: We FILTER DATA if we want to get specific information from our DATA/TABLE
① It is a way to exclude the rows of DATA that do not meet the specified criteria
② You want a specific information
* We filter based on conditions

Syntax: SELECT Student_id, name, marks or SELECT * (single column)
FROM student_results
WHERE marks > 60;

Syntax: SELECT *
FROM retail_store_dataset
WHERE GENDER = 'Male' AND Prod_cat = 'Clothing';

student_results.

Student_Id	Name	Marks
101	Rofni	99
102	Mbali	25
103	Thabo	50
104	Letlaba	60

Practice on the stage. Statements

@ wschools

P. 933 From Intro to SQL - eBook of

Basic Syntax (Basic SQL syntax)

The ; is required. Every statement needs to end with a SemiColon.

As a good practice, all SQL keywords should be with uppercase, however, it would work just fine if you use lower case as well.

(SELECT *) As we specify * right after the select key word, this means that we want to get all of the columns from the user table.

NB! Comments (statement) → In case that you are writing a larger SQL script, it might be helpful to add some comments so that later on you can remember or know what each line does.

2 TYPES OF COMMENTS inline comments.
e.g. SELECT * FROM users -- GET ALL students/users

• Multiple-line Comments

Similar to some prog lang you could wrap the text in

/* */ as follow

/*

GET all of the users
from your database

*/

SELECT * FROM user;

• Formatting:

NB!! As we know SQL statement need to end with semi-column; Alternatively we could use \G characters which would format the output in a list rather than a table.

The Syntax is the same but you just change the semi-column; with \G character:

Limit B 48 []

WHERE Statement / Clause

Syntax: SELECT (column_name)
FROM table_name
WHERE column = (some value);

0765522660

WHERE:

The WHERE ^{Statement} clause allows you to specify different conditions so that you could filter out the data and get the specific set.

NB!!! you would add the WHERE statement after the FROM statement.

The Syntax: SELECT column_name

FROM table_name

WHERE column = (some_value);

WHERE column = (some_value);

Operators

NB!!!! WHERE column = (conditions);
WHERE column = (some_value);

A List of popular operators are:

- != : not equal operator
- > : Greater than
- >= : Greater than or equal operator
- <= : Less than or equal operator
- < : Less than operator

AND keyword

In some cases, you might want to specify multiple criteria. For example, you might want to get all users that are active, and the username matches a specific value.

Syntax: SELECT * FROM user
WHERE username = 'bobby' AND active = 'true';

AND key word notes continuity

If we were to change the AND statement to `Active = False`, we would not get any results back as none of the entries in our database match that condition.

Syntax: `SELECT * FROM users WHERE username = 'bobby' AND Active = False;`

-- Output:

Empty set (0.01 sec)

OR keyword

In some cases, you might want to specify multiple criteria. For example, you might want to get all users that are active, or their username matches a specific value. This could be achieved with the OR keyword.

The main difference between AND and OR is that with AND, the results would only return the values that match the two conditions, and with OR, you would get a result that matches either of the conditions. All spec value (not active) and username.

e.g. If we run same query as above but change AND to OR we would have all users that have the username bobby and also all user that are not active.

Syntax: `SELECT * FROM users WHERE username = 'bobby' OR Active = 'False';`

LIKE operator

Unlike = operator, the LIKE operator allows you to do wildcard matching similar to the * symbol in Linux.

e.g. if you want to get all users that have the y letter in them, you would run the following syntax:

Syntax: `SELECT * FROM users WHERE username LIKE '%y%';`
`WHERE username LIKE '%5%';`

This is quite handy when you are building some search functionality for an/mg application.

IN operator

The IN operator allows you to provide a list expression and would return the results that matches that list of values.

e.g. if you wanted to get all users that have the username (list expression) bobby and devdjo, you could use the following:

Syntax: `SELECT * FROM users WHERE username IN ('bobby', 'devdjo');`

This helps simplify your WHERE expression so that you don't have to add numerous OR statements.

IS Operator

If you were to run `SELECT * FROM users WHERE about = NULL` you would get an empty result set as the `=` operator can't be used to check for null values. Instead, you would need to use the `IS` operator instead

The `=` operator can't check null values
The `IS` operator is only used to check NULL value, and the syntax is the following:

Syntax: `SELECT * FROM users WHERE about IS NULL`

If you want to get the result where the value is not NULL, you just need to change `IS` to `IS NOT`

Syntax: `SELECT * FROM users WHERE about IS NOT NULL`

CONCLUSION

We have
In this chapter, you've learned how to use the `WHERE` statement / clause with different operators to get different type of result based on the parameters that you provide

In the next chapter, we will learn how to order the result set.

Data Filtering From month one till month 3

By using a where (it is a very important statement)

* SQL Operators

1. Arithmetic Operators 2. Comparison Operators

Operator	Description	Operator	Description
+	Addition	=	equal to
-	Subtraction	>	Greater than
*	Multiplication	<	less than
/	Division	>=	Greater than or equal to
		<=	less than or equal

This are the same in the Python language

3. Logical Operators

Operator	Description	Operator	Description
AND	Both condition must be met	OR	one condition must be met
BETWEEN	Must be within the range	IN	must be contained within the list
NOT	It is / gives the opposite result of what is specified	LIKE	Books for a pattern (like 'as%')

Let's start with the basics

Example: James Marshaba
Operator SQL - Is or the tools we are using
use it

THE DATA FILTERING - WHERE statement
we filter our

It is a filtering statement, that we use to
filter our data based on specific condition

We can use the SQL operator to build the
condition for filtering our data.

Syntax: is the way you structure the
coding

Syntax: select column 1

column 2

column 3

from table-name
where condition;

We use SQL operators to build the condition for filtering
our data

We use SQL operators to build conditions for filtering
types of operators - 1 Arithmetic operators
2 Comparison operators
3 Logical operators

Return - must be within the range including + - / *
Not - the opposite of the listed condition.
And - condition to be met
Or - condition to be met
Like - it must be part of the statement
Like - pattern like 25%

user_id	user_name	city
1	Nomura	QTB
2	David	CPI
3	Abel	DBB
4	KABELO	PTA
5	LEPATO	PE

SELECT * FROM users
WHERE city = 'Urban';
Because it's a word
in the box it is a condition

Out come of the above SQL query

user_id	user_name	city
3	Abel	Urban

Membership Plan

Plan_id	Plan-name	Monthly-price
101	Basic	79
102	Standard	129
103	Premium	199
104	Family	249
105	Mobile	59

SELECT plan-name, monthly-price
FROM membership-plan
WHERE monthly-price > 150

Plan-name	Monthly-price
Premium	199
Family	249

users-table
column name
value in the column

Write on SQL query
to give me the
name of users
that are in DB

WHERE condition = Urban
we used the operator to
build the condition
